<http://www.inf-cv.uni-jena.de>

1 Changes/Incorporation of Reviews

- inclusion of SVM + results
- evaluation of masking as a potential preprocessing step
- more results for each classifier
- more dataset samples in order to show variability
- inclusion of resized and altered images/plots in order to increase readability
- refined evaluation of parameters
- more citations

Please also note that the recognition rates changed since we fixed a small issue in the RDF and the range histogram feature computation. Although quantitative changes have been observed, no qualitative changes in our results occurred.

With kindest regards,

Michael Kemmler.
